

3 e gr. vgl. oplossen.

Kies $P_1 = (0,1)$

$$L_1 = \{(x,y) \in \mathbb{R}^2 : y = -1\}$$

$$P_2 = (s,t)$$

$$L_2 = \{(x,y) \in \mathbb{R}^2 : x = u\}$$

s, t, u nader te bepalen.

normaal: $(a, -2)$

$P_1 \mapsto (a, -1)$ op L_1 ; v.w.lijn: $(\frac{1}{2}a, 0) + \lambda \cdot (2, a)$, ~~bestredet~~

$$P_2 = (s, t)$$

$$\text{vgl: } * ax - 2y = \frac{1}{2}a^2$$

$$L_2: x = u$$

Nu beeld van P_2 nitrekemen: $(s, t) + \frac{1}{2}\lambda \cdot (a, -2)$ is op v.w.lijn

$$(s + \frac{1}{2}\lambda a, t - \lambda) \quad \text{vgl: } as + \frac{1}{2}\lambda a^2 - 2t + 2\lambda = \frac{1}{2}a^2$$

$$\text{Dat geeft: } \lambda = \frac{\frac{1}{2}a^2 + 2t - as}{\frac{1}{2}a^2 + 2} = \frac{a^2 + 4t - 2as}{a^2 + 4}$$

Dus beeld van P_2 :

$$(s, t) + \frac{a^2 + 4t - 2as}{a^2 + 4} \cdot (a, -2)$$

$$\text{Vgl. voor } x\text{-coörd} = u: \quad s + a \cdot \frac{a^2 + 4t - 2as}{a^2 + 4} = u$$

$$\text{ohvd: } s a^2 + 4s + a^3 + 4ta - 2sa^2 = u a^2 + 4u$$

$$\text{ohvd: } a^3 + \underbrace{(-s-u)}_{c_2} a^2 + \underbrace{4ta}_{c_1} + \underbrace{4(s-u)}_{c_0} = 0$$

We willen s, t, u zo kiezen dat:
$$\begin{cases} s + u = -c_2 \\ 4t = c_1 \\ 4 \cdot (s - u) = c_0 \end{cases}$$

Vb: verdubbeling kubus: $a = \sqrt[3]{2}$ $a^3 - 2 = 0$ $c_2 = 0, c_1 = 0, c_0 = -2$

dat geeft: $t = 0, u = -s, 8s = -2$, dus $s = -\frac{1}{4}, u = \frac{1}{4}$.
